## 9. FUNCTION SPECIFICATIONS

### 9.1. Resetting The LCD Module

The LCD module should be initialized by setting /RST terminal at low level when turning the power on. See the reset timing section for detail.

Reset pulse width	$t_{rw}$	2.0	—	—	$\mu S$

The initialized status is as follow:

Function	Initialized Status
Enter Mode Set	<b>I/D=1</b> cursor move to right <b>S=0</b> DDRAM address counter
Display status	<b>D=0</b> display=OFF <b>C=0</b> cursor=OFF <b>B=0</b> cursor position blink=OFF

# 广州鑫平电子科技有限公司

Function Set	DL=1 8-bit interface RE=0 Basic Instruction Set
Scroll Or RAM Address select	SR=0 CGRAM address access is enable
Reverse	R1=1,R0=0 First line normal
Extended Function Set	G=0 Graphic display OFF

## 9.2. Using Parallel Interface

When PSB=H, the LCD module is in parallel interface mode. 8-bit or 4-bit bus interface could be selected by FUNCTION SET instruction DL bit.

In 4-bit bus interface, every 8-bit instruction/data is separated into two parts. First, transfer the higher 4-bit(D7-D4), then transfer the lower 4-bit(D3-D0). They are transferred via DB7-DB4 terminals, where DB3-DB0 are not in used (leave open or pull high).

## 9.3. Using Serial Interface

When PSB=L, the LCD module is in serial interface mode (write only). In this mode, CS pin should be used. CS=H, enable the data transfer. CS=L, reset the serial data counter, terminate the data transition and clear the data buffer. As the controller IC has no instruction buffer area, it must wait for the previous instruction to finish before sending the next one. Thus transferring multiple instruction/data, execution time must be considered. Starting a transmission, a start byte is required. It consists 5 consecutive "1" follow with a "0", as RS bit (register select bit) and a "0". Then the 8-bit instruction/data should be separated into 2 groups. First group is DB7-DB4, followed by 4 consecutive "0". The second group is DB3-DB0 with 4 consecutive "0". See the follow data sequence diagram for detail:

## 9.4. Display Memory Map

There are 3 main memory-areas in the LCD module for display.

- Character Generator RAM (CGRAM);
- Graphic Display RAM (GDRAM);
- Display Data RAM (DDRAM).

# 广州鑫平电子科技有限公司

## 9.4.1 Character Generator RAM (CGRAM)

Character Generator RAM is for storing the User-defined characters (a 16×16 dots font). There are only 4 characters could be defined. The User-defined character codes are 0000h, 0002h, 0004h and 0006h. They could be called into DDRAM as normal character.

User-defined Character Code	CGRAM Address	CGRAM data	
		D15 ~ D8	D7 ~ D0
0000h	00h : 0Fh	16 x 16 dot font	
0002h	10h : 1Fh	16 x 16 dot font	
0004h	20h : 2Fh	16 x 16 dot font	
0006h	30h : 3Fh	16 x 16 dot font	

**CGRAM Address Map**

## 9.4.2 Graphic Display RAM (GDRAM)

GDRAM is for full graphics display. It could be displayed when G=1(set by Extended Function Set in Extended instruction Set ).

		Horizontal Address (X)				
		00h	01h	~	06h	07h
		D15 ~ D0	D15 ~ D0	~	D15 ~ D0	D15 ~ D0

Note:

- The mapping is based on Vertical Scroll Displacement Address=0;

## 9.4.3 Display Data RAM (DDRAM)

GB character code (16-bit, A1A0h-F7FFh) could write into DDRAM for displaying the simplified Chinese character ( $16 \times 16$  dots font). User characters defined by user that stored in CGRAM could also be used. The display character should be on grid only.

		DDRAM Address (Lower 4bit)													
		00h		01h		02h		~		05h		06h		07h	
		H	L	H	L	H	L	~		H	L	H	L	H	L
DDRAM Address (Upper 4bit)	80h	8 x 2 Characters (16x16 dots font)

- 10.5. When mounting the LCD module, make sure that it is free from twisting, warping and distortion.
- 10.6. Ensure to provide enough space(with cushion) between case and LCD panel to prevent external force adding on it, or it may cause damage to the LCD or degrade the display result
- 10.7. Only hold the LCD module by its side. Never hold LCD module by add force on the heat seal or TAB.
- 10.8. Never add force to component of the LCD module. It may cause invisible damage or degrade of the reliability.
- 10.9. LCD module could be easily damaged by static electricity. Be careful to maintain an optimum anti-static work environment to protect the LCD module.
- 10.10. When peeling of the protective film from LCD, static charge may cause abnormal display pattern. It is normal and will resume to normal in a short while.
- 10.11. Take care and prevent get hurt by the LCD panel edge.
- 10.12. Never operate the LCD module exceed the absolute maximum ratings.
- 10.13. Keep the signal line as short as possible to prevent noisy signal applying to LCD module.
- 10.14. Never apply signal to the LCD module without power supply.
- 10.15. IC chip (eg. TAB or COG) is sensitive to the light. Strong lighting environment could possibly cause malfunction. Light sealing structure casing is recommend.
- 10.16. LCD module reliability may be reduced by temperature shock.
- 10.17. When storing the LCD module, avoid exposure to the direct sunlight, high humidity, high temperature or low temperature. They may damage or degrade the LCD module
